METHOD OF RADIATION TREATMENT FOR FLUOROPOLYMER MATERIALS

Abstract of the Disclosure

A source of radiation (10,12), particularly a pulsed accelerated electron beam, directs a beam of radiation through an irradiation chamber (14, 50). irradiation chamber is depleted of oxygen and oxygen containing gases, such as being drawn to a vacuum of 10^{-1} or greater Torr by a vacuum pump (20, 52). Particulate fluoropolymer material is entrained (36) in substantially oxygen free gas and conveyed through the irradiation The accelerated electrons break chemical bonds in the fluoropolymer particles and electrostatically Magnetic fields (42, 60) of charge the particles. different polarity rotate the charged particles such that they are irradiated from different sides. The irradiated fluoropolymer particles are cooled (24) and separated (26) The entraining qas. from the entraining recirculated through pneumatic line (34) for a continuous In an alternate batch processing embodiment, the fluoropolymer material is placed in the shallow container (50) which is sealed and evacuated. The container is conveyed through the pulsed electron beam.
